MISE EN ABYME: CLOUD PRIMARY PERSONAL COMPUTERS

by Thomas Denton, ApostleMod

Overview

Mise En Abyrne is ApostleMod's project to create Cloud (primary personal) Computers.

Cloud desktops are the next step in the evolution of computers. The microcomputers of the 1970-1980 were inseparable from their software, the PCs overcame this limit but still are inseparable from their physical presence.

Cloud computers of Mise En Abyrne are designed to correct this problem.

This technology became possible because of two technological improvements: high-speed Internet and Nvidia GRID, a cloud GPU.

Intel Xeon processor

+

96 GB RAM

+

17Tb of SAN

+

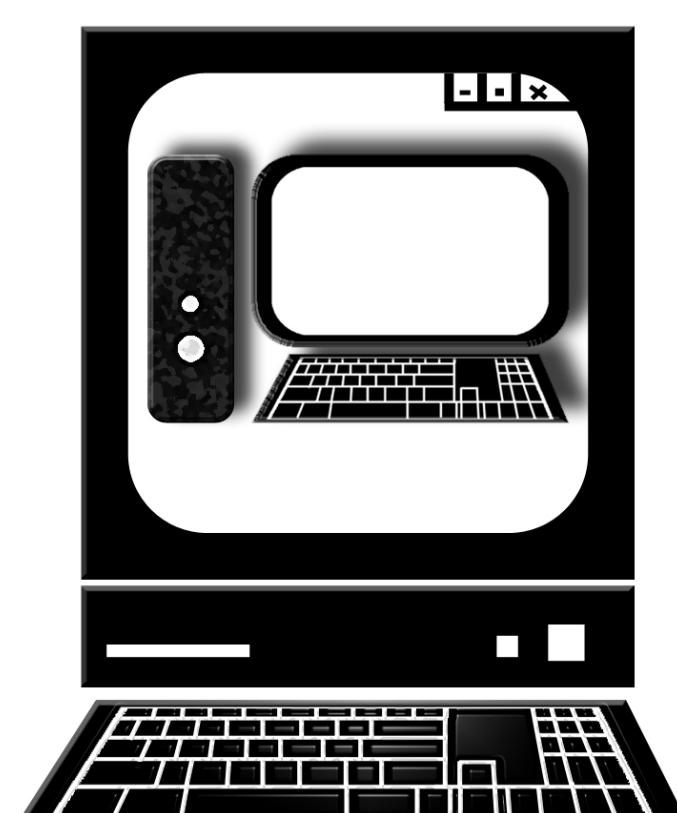

=

16 Virtual Machines

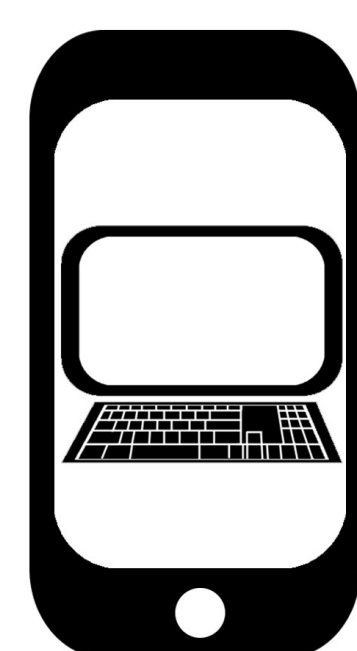

In the datacenter powered by Nvidia GRID K520 all hardware will be shared and users won't have to have dedicated hardware to get exceptional personal computer experience.

Personal-Desktop-as-a Service

GaaS, DaaS

IaaS, PaaS

The benefit of putting a PC in the cloud is that the client device can be low-end, mobile or legacy.

Results

This poster was created entirely on a cloud computer of Mise En Abyrne closed Beta. The closed Beta created cloud computers running Windows 8.1, Windows 10, Ubuntu Linux and other OSes.
